Spectra	al rigidity				

 $\widetilde{X}$  smooth manifold of dimension  $n \ge 2$ Billiard table in  $\widetilde{X}$  - smooth compact Riemannian manifold  $(X,g), X \subset \widetilde{X}$ , with boundary  $\Gamma$ , dim X = n.  $C^1$  deformation of  $(X,g) - C^1$  family of billiard tables  $(X_t, g_t)$  in  $\widetilde{X}$ , where  $X_0 = X$  and  $g_0 = g$  $\Delta_t$  - the corresponding L-B operator with Dirichlet boundary

conditions on  $\Gamma_t$ . The deformation is

- isospectral if Spec  $(\Delta_t) =$ Spec  $(\Delta_0)$  for each t
- trivial if there is a family of diffeomorphisms  $\psi_t : X_0 \to X_t$ such that  $\psi_0 = \text{Id}$  and  $\psi_t^* g_t = g_0$ .

 $X_0$  is spectrally rigid if every isospectral deformation of  $X_0$  is trivial.

Question : Is the ellipse (ellipsoid) spectrally rigid in  $\mathbb{R}^2$  ( $\mathbb{R}^n$ )?

Spectral rigidity<br/>o ● 0Weak isospectral condition<br/>oKAM tori. Mather's β-function.<br/>o 0Isospectral invariants<br/>o 0Applications<br/>o 0Idea of the proof<br/>o 0

How to relate Spec ( $\Delta$ ) to the the geometry ? 1) Heat invariants :

$$\sigma_h(t) = \sum_j e^{-\lambda_j t} = \operatorname{tr}\left(e^{-t\Delta}\right), t > 0,$$
  
 $\sigma_h(t) \sim c_0 t^{-n/2} + c_1 t^{-(n-1)/2} + \cdots \text{ as } t \searrow 0$ 

2) Wave-trace method :

$$\sigma_{w}(t) = \sum_{j} \cos(t\sqrt{\lambda_{j}}) = \operatorname{tr}\left(\cos(t\sqrt{-\Delta})\right), t \in \mathbb{R},$$
  
s.s.  $(\sigma_{w}) \subset \{\pm \ell : \ell \in \mathcal{L}(X)\} \cup \{\mathbf{0}\}$

- Recovery of the boundary Zeditch, Hezari-Zelditch

Spectral rigidity	Weak isospectral condition	KAM tori. Mather's $\beta$ -function.	Isospectral invariants	Applications	Idea of the proof
000	0	0000	0	0000000	00

- Closed Riemannian manifolds of negative sectional curvature are spectrally rigid : Guillemin-Kazhdan n = 2 (1980), Croke-Sharafutdinov  $n \ge 2$  (1998), Anosov flows (n = 2) - Paternain-Salo-Uhlmann (2013).

- Infinitesimal rigidity of the ellipse - Hezari-Zelditch (2013).

The wave-trace method requires certain technical assumptions such as simplicity of the length spectrum (a non-coincidence condition) and non-degeneracy of the corresponding closed geodesic and its iterates.

We propose another method which avoids these assumptions.

# 3) Method based on a quasi-mode construction (Popov-Topalov, CPDE 2012)

Instead of trying to recover the BNF from the coefficients of the complete singular expansion at a given length t = T, we are looking for the first Birkhoff invariant for a large family of invariant tori which can be regarded as a Radon transform.

Fix d > 0 and c > 0. Consider  $\mathcal{I} \subset (0, \infty)$  such that

(H<sub>1</sub>)  $\mathcal{I}$  - union of infinitely many disjoint intervals [ $a_k$ ,  $b_k$ ] where

•  $\lim a_k = \lim b_k = +\infty$ ,

•  $b_k - a_k = o\left(\sqrt{a_k}\right)$  as  $k \to \infty$ 

•  $a_{k+1} - b_k \ge cb_k^{-d}$  for any  $k \in \mathbb{N}$ .

 $[a_k, b_k]$  going to infinity, of length  $o(\sqrt{a_k})$ , and polynomially separated.

 $(\mathsf{H}_2) \exists a \geq 1 \text{ s.t. } \forall t \in [0,1], \text{ Spec} (\Delta_t) \cap [a,+\infty) \subset \mathcal{I}.$ 

Isospectrality implies weak isospectralitry (take d > n/2).

# Examples :

- Liouville billiard tables : [Popov-Topalov, ETDS 2003, 2008, CMP 2011]

- Elliptic broken geodesics

- Strictly convex billiard tables in  $\mathbb{R}^2$  - Lazutkin caustics :  $\beta(\omega) = \omega I(\omega) - L(I(\omega))$  where  $L(I(\omega))$  is the Lazutkin parameter of the corresponding caustic  $C(\omega)$  and  $I(\omega)$  is its length.

# Isospectral invariants

#### Theorem (Popov-Topalov, 2013)

Let  $(X_t, g_t)$ ,  $t \in [0, 1]$ , be a  $C^1$  family of compact billiard tables satisfying the weak isospectral condition  $(H_1) - (H_2)$ . Let  $[0, \delta) \ni t \to \Lambda_t(\omega)$  be a  $C^1$  family of invariant tori of  $P_t = B_t^m$ with vectors of rotation  $\omega \in \Omega_{\kappa}$ . Then  $\beta_t(\omega)$  is independent of  $t \in [0, \delta]$  for any  $\omega \in \Omega_{\kappa}$ .

Remark. Although the invariant tori  $\Lambda_t(\omega)$  may not exist at  $t = \delta$  the  $\beta$ -function is well defined and it is continuous in  $t = \delta$  for twist maps.

For any  $t \in [0, \delta)$  the function  $\beta_t$  is  $C^{\infty}$  on  $\Omega_{\kappa}$  in Whitney sense.

# Applications

1. Infinitesimal rigidity of ellipsoidal billiard tables

#### Theorem (Popov-Topalov, CMP, 2011)

The billiard ball map of an ellipsoidal billiard table in  $\mathbb{R}^n$  is a non-degenerate (in Kolmogorov sense) completely integrable symplectic map.

Let  $X_0$  be the ellipsoidal billiard table in  $\mathbb{R}^n$ . Applying (a variant) of the KAM theorem to  $B_t$  near an invariant torus  $\Lambda_0(\omega)$ ,  $\omega \in D(\kappa, \tau)$ , one obtains a  $C^1$  family of invariant tori  $\Lambda_t(\omega)$  of  $B_t$ . Suppose that the family is weakly isospectral. Then the main Theorem implies  $\beta_t(\omega) = \beta_0(\omega)$  for any  $\omega \in \Omega$  and  $0 \le t < \delta$ .

Spectral rigidity	Weak isospectral condition	KAM tori. Mather's $\beta$ -function.	Isospectral invariants	Applications	Idea of the proof
000	0	0000	0	000000	00

Proposition (Popov-Topalov, 2013)

Let  $\Gamma_t = \{x + a_t(x)\nu(x) : x \in \Gamma_0\}$ , where  $\nu : \Gamma_0 \to S^{n-1}$  is a normal vector field. Then

$$rac{d}{dt}eta_t(\omega)|_{t=0}=0 \quad \Leftrightarrow \quad \int_{\Lambda_0(\omega)} rac{d}{dt}a_t|_{t=0}d\mu=0$$

Here  $d\mu$  is the unique probability measure on  $\Lambda_0(\omega)$  which is invariant with respect to  $P_0$ .

Hence, the Radon transform of  $\frac{d}{dt}a_t|_{t=0}$  is identically zero

$$\forall \omega \in \Omega, \ \int_{\Lambda_0(\omega)} rac{d}{dt} a_t|_{t=0} d\mu = 0$$

◆□▶ ◆□▶ ▲□▶ ▲□▶ ■ ののの

#### Theorem (Popov-Topalov, CMP, 2011)

Let  $f \in C(\Gamma_0)$  be invariant under the symmetries of the ellipsoid  $\Gamma_0$ . Then

$$\forall \omega \in \Omega, \ \mathcal{R}_f(\Lambda_0(\omega)) := \int_{\Lambda_0(\omega)} f \, d\mu = 0 \quad \Longrightarrow \quad f \equiv 0$$

Ellipse Guillemin-Melrose (1978), Liouville billiard tables n = 2Popov-Topalov (2003), Liouville billiard tables n = 3Popov-Topalov (2011). This implies infinitesimal rigidity : the first variation of  $a_t$  at t = 0 is 0 if  $a_t$  is invariant under the symmetries of the ellipsoid. If  $t \rightarrow a_t$  is  $C^{\infty}$  then  $a_t$  is flat at t = 0. Holds for Liouville billiard tables. For the ellipse (n = 2) Hezari-Zelditch (Analysis PDE, 2013).

# 2. Elliptic geodesics

Let  $\gamma$  be a closed elliptic. Denote by  $e^{\pm 2\pi\alpha_k i}$ ,  $1 \le k \le n-1$ , the eigenvalues of the linear Poincaré map *DP*, where  $\alpha_k \in (0, 1/2)$  and set  $\alpha = (\alpha_1, \ldots, \alpha_{n-1})$ . Suppose that  $\gamma$  is 4-elementary (no resonances of order  $\le 4$ ) which means that  $\langle \alpha, k \rangle \ne 0$  for any  $k \in \mathbb{Z}^{n-1}$  with  $|k| := |k_1| + \cdots + |k_{n-1}| \le 4$ . Then the corresponding Poincaré map *P* admits BNF

 $P(\theta, r) = (\theta + 2\pi\alpha + Br, r) + O(|r|^{3/2}).$ 

Let the BNF be non-degenerate, i.e. det  $B \neq 0$ . Then one can apply the K.A.M. theorem for  $C^1$ -deformations of P.

Spectral rigidity	Weak isospectral condition	KAM tori. Mather's $\beta$ -function.	Isospectral invariants	Applications	Idea of the proof
000	0	0000	0	0000000	00

#### Theorem (Popov-Topalov, 2013)

Let  $(X_t, g_t)$ ,  $t \in [0, 1]$ , be a  $C^1$  family of compact Riemannian manifolds (convex billiard tables) satisfying  $(H_1) - (H_2)$ . Suppose that  $(X_0, g_0)$  admits a (broken) closed elliptic 4-elementary geodesic  $\gamma_0$  with a non-degenerate BNF. Then

• there exists a  $C^1$  family of elliptic orbits  $\gamma_t$ ,  $t \in [0, 1]$ ,

- there is a set Ω ⊂ ℝ<sup>n-1</sup> of Diophantine vectors such that meas (Ω ∩ B(α, ϵ))/meas B(α, ϵ) = 1 − O(ϵ) and for any ω ∈ Ω a C<sup>1</sup> family of Kronecker invariant tori Λ<sub>t</sub>(ω), t ∈ [0, 1], of the corresponding local Poincaré maps P<sub>t</sub>
- **③**  $\forall \omega \in \Omega$  and *t* ∈ [0, 1],  $\beta_t(\omega) = \beta_0(\omega)$ .

Deformations of Rienannian metrics with the same length spectrum [Popov, Math. Z. 93].

Applications : spectral rigidity of  $\mathbb{Z}_2 \times \mathbb{Z}_2$  billiard tables.

#### Define a class of billiard tables as follows.

Let  $(\widetilde{X}, g)$ , dim  $\widetilde{X} = 2$  be a real analytic Riemannian manifold of dimension two. Suppose that it admits two commuting involutions  $\mathcal{J}_k$ , k = 1, 2, acting as isometries. Consider the family  $\mathcal{B}$  of analytic billiard tables (X, g) in  $(\widetilde{X}, g)$  which are invariant with respect to  $\mathcal{J}_k$ , k = 1, 2. Then the set of fixed points of  $\mathcal{J}_k$ , defines a bouncing ball geodesic  $\gamma_k$  for k = 1, 2,

#### Corollary

Let  $(X, g) \in \mathcal{B}$ . Suppose that the broken geodesic  $\gamma_1$  is elliptic, 4-elementary and that the corresponding BNF is non-degenerate. Then (X, g) is spectrally rigid in  $\mathcal{B}$ .

Exemple : Classical Liouville billiard tables. It follows from the main theorem and a variant of the above proposition using a simple argument of Popov-Topalov CPDE (2012) Spectral rigidity Weak isospectral condition KAM tori. Mather's *β*-function. Isospectral invariants Applications Idea of the proof

# 3. Strictly convex billiard tables

Theorem (Popov-Topalov, 2013)

Let  $X_t \subset \mathbb{R}^2$ ,  $t \in [0, 1]$ , be a  $C^1$  family of compact billiard tables in  $\mathbb{R}^2$  satisfying the weak isospectral condition  $(H_1) - (H_2)$ . Suppose that  $X_0$  is strictly convex. Then

- **1**  $X_t$  is strictly convex for each  $t \in [0, 1]$
- 2 There is a Cantor set  $\Omega \subset (0, 1]$  consisting of Diophantine numbers such that meas  $(\Omega \cap (0, \varepsilon)) / \varepsilon = 1 - O_N(\varepsilon^N)$  as  $\varepsilon \to 0^+$  and such that  $\forall \omega \in \Omega$  there is a  $C^1$  family of Kronecker invariant circles  $[0, 1] \ni t \to \Lambda_t(\omega)$  of  $B_t$  of rotation number  $\omega$ .

●  $\forall \omega \in \Omega$  and  $t \in [0, 1]$ ,  $I_t(\omega) = I_0(\omega)$ ,  $L_t(I_t(\omega)) = L_0(I_0(\omega))$ .

Recall that  $I_t(\omega)$  is the length and  $L_t(I_t(\omega))$  is the Lazutkin parameter of the caustic  $C_t(\omega)$ . Billiard tables with the same length spectrum [Popov, CMP 94] (ロ) (同) (三) (三) (三) (○) (○)

# Idea of the proof

Main ingredients :

- KAM theorem with parameters ( $t \rightarrow P_t$  a  $C^1$  family)
- Construction of C<sup>1</sup> with respect to t quasi-modes (P-T, CPDE 2012)

Quasi-modes of order  $N \ge 0$  associated with  $\Lambda_t(\omega)$ : Fix  $t \in [0, \delta)$ . There is a unbounded index set  $\mathcal{M}_t(\omega) \subset \mathbb{Z}^n$  and for any  $q \in \mathcal{M}_t(\omega)$  and  $s \in [t, t + 2/|q|]$  a quasi-mode  $(u_{s,q}, \mu_q(s)^2)$  such that

- $u_{s,q} \in D(\Delta_s) \cap C^{\infty}(\widetilde{X})$  and  $||u_{s,q}||_{L^2(X_t)} = 1$ ,
- $\mu_q \in C^1([t, t+2/|q|])$  and  $\mu_q(s) \geq C|q|$ ,
- there is  $C_N > 0$  such that

$$\left\| \Delta_{s} \, u_{s,q} \, - \, \mu_{q}^{2}(s) \, u_{s,q} \right\|_{L^{2}(X_{s})} \, \leq \, C_{N} \, \mu_{q}(s)^{-N}$$

 $\mu_q(s)$  determines  $\beta_s(\omega)$  up to  $o(|q|^{-1})$  as  $q \to \infty$  for rotation vectors  $\omega$  in a dense subset  $\Omega_{\kappa}^t \subset \Omega_{\kappa}$ :

 $\mu_{q}(s) = \mu_{q}(t) + o_{\omega}(1) \implies \beta_{s}(\omega) = \beta_{t}(\omega) + o_{\omega}(|q|^{-1})$ uniformly in  $s \in [t, t + 2/|q|].$ 

#### Lemma

Suppose that  $(H_1) - (H_2)$  holds. Then

 $\mu_q(s) = \mu_q(t) + o_\omega(1)$  as  $q \to \infty$ 

uniformly in  $s \in [t, t + 2/|q|]$ .

We have  $|\operatorname{Spec}(\Delta_s) - \mu_q(s)^2| \leq C_N \mu_q(s)^{-N}$ . Take N > 2d. Then  $(H_1) - (H_2)$  implies  $|\mu_q(s)^2 - \mu_q(t)^2| = o(\mu_q(s))$  as  $q \to \infty$ . Hence,  $\frac{d}{dt}\beta_t(\omega) = 0$  on  $\Omega_{\kappa}^t$  and by continuity on  $\Omega_{\kappa}$ .
