Strong law and central limit theorem

Let (X_n) be a sequence of iid random variables and set

$$S_n = \sum_{k=1}^n X_k.$$

If $X_n \in \mathbb{L}^2(\mathbb{R})$ with $\mathbb{E}[X_n] = m$ and $\text{Var}(X_n) = \sigma^2$, we have

$$\frac{S_n}{n} \longrightarrow m \quad \text{a.s.}$$

$$\frac{S_n - nm}{\sqrt{n}} \xrightarrow{\mathcal{L}} \mathcal{N}(0, \sigma^2)$$

Idea. Require more on (X_n) to obtain sharp results on tails

The Gaussian sample

Assume that $X_n \sim \mathcal{N}(0, \sigma^2)$ so that $S_n \sim \mathcal{N}(0, \sigma^2 n)$. For all $c > 0$,

$$\mathbb{P}(S_n \geq nc) \sim \frac{\sigma}{c\sqrt{2\pi n}} \exp\left(-\frac{c^2 n}{2\sigma^2}\right).$$

Therefore,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}(S_n \geq nc) = -\frac{c^2}{2\sigma^2}.$$

Question. Is this limit true in the non Gaussian case ?

Let L be the log-Laplace of (X_n) . The Fenchel-Legendre dual of L is

$$I(c) = \sup_{t \in \mathbb{R}} \{ct - L(t)\}.$$

Theorem (Cramer-Chernov)

The sequence (S_n/n) satisfies an **LDP** with rate function I

- **Upper bound:** for any closed set $F \subset \mathbb{R}$

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}\left(\frac{S_n}{n} \in F\right) \leq - \inf_F I,$$

- **Lower bound:** for any open set $G \subset \mathbb{R}$

$$\liminf_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}\left(\frac{S_n}{n} \in G\right) \geq - \inf_G I.$$

Let L be the log-Laplace of (X_n) . The Fenchel-Legendre dual of L is

$$I(c) = \sup_{t \in \mathbb{R}} \{ct - L(t)\}.$$

Theorem (Cramer-Chernov)

The sequence (S_n/n) satisfies an **LDP** with rate function I

- **Upper bound:** for any closed set $F \subset \mathbb{R}$

$$\limsup_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}\left(\frac{S_n}{n} \in F\right) \leq - \inf_F I,$$

- **Lower bound:** for any open set $G \subset \mathbb{R}$

$$\liminf_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}\left(\frac{S_n}{n} \in G\right) \geq - \inf_G I.$$

On the Cramer-Chernov theorem

The rate function I is convex with $I(m) = 0$. Therefore, for all $c > m$,

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}(S_n \geq nc) = -I(c).$$

- **Gaussian:** If $X_n \sim \mathcal{N}(0, \sigma^2)$ with $\sigma^2 > 0$,

$$I(c) = \frac{c^2}{2\sigma^2}.$$

- **Exponential:** If $X_n \sim \mathcal{E}(\lambda)$ with $\lambda > 0$,

$$I(c) = \begin{cases} \lambda c - 1 - \log(\lambda c) & \text{if } c > 0, \\ +\infty & \text{otherwise.} \end{cases}$$

On the Bahadur-Rao theorem

Theorem (Bahadur-Rao)

Assume that L is finite on all \mathbb{R} and that the law of (X_n) is absolutely continuous. Then, for all $c > m$,

$$\mathbb{P}(S_n \geq nc) = \frac{\exp(-nl(c))}{\sigma_c t_c \sqrt{2\pi n}} [1 + o(1)]$$

where t_c is given by $L'(t_c) = c$ and $\sigma_c^2 = L''(t_c)$.

Remark. The core of the proof is the Berry-Esséen theorem.

Theorem (Bahadur-Rao)

(S_n/n) satisfies an **SLDP** associated with L . For all $c > m$, it exists $(d_{c,k})$ such that for any $p \geq 1$ and n large enough

$$\mathbb{P}(S_n \geq nc) = \frac{\exp(-nl(c))}{\sigma_c t_c \sqrt{2\pi n}} \left[1 + \sum_{k=1}^p \frac{d_{c,k}}{n^k} + \mathcal{O}\left(\frac{1}{n^{p+1}}\right) \right].$$

Remark. The coefficients $(d_{c,k})$ may be explicitly given as functions of the derivatives $l_k = L^{(k)}(t_c)$. For example,

$$d_{c,1} = \frac{1}{\sigma_c^2} \left(\frac{l_4}{8\sigma_c^2} - \frac{5l_3^2}{24\sigma_c^4} - \frac{l_3}{2t_c\sigma_c^2} - \frac{1}{t_c^2} \right).$$

Gaussian quadratic forms

Let (X_n) be a centered stationary real Gaussian process with spectral density $g \in L^\infty(\mathbb{T})$

$$\mathbb{E}[X_n X_k] = \frac{1}{2\pi} \int_{\mathbb{T}} \exp(i(n-k)x) g(x) dx.$$

We are interested in the behavior of

$$W_n = \frac{1}{n} \mathbf{X}^{(n)t} M_n \mathbf{X}^{(n)}$$

where (M_n) is a sequence of Hermitian matrices of order n and

$$\mathbf{X}^{(n)} = \begin{pmatrix} X_1 \\ \vdots \\ X_n \end{pmatrix}.$$

Toeplitz and Cochran

Let $T_n(g)$ be the covariance matrix of $X^{(n)}$. By the Cochran theorem,

$$W_n = \frac{1}{n} \sum_{k=1}^n \lambda_k^n Z_k^n$$

- $\lambda_1^n, \dots, \lambda_n^n$ are the eigenvalues of $T_n(g)^{1/2} M_n T_n(g)^{1/2}$,
- Z_1^n, \dots, Z_n^n are iid with $\chi^2(1)$ distribution.

The normalized cumulant generating function of W_n is

$$L_n(t) = \frac{1}{n} \log \mathbb{E} \left[\exp(ntW_n) \right] = -\frac{1}{2n} \sum_{k=1}^n \log(1 - 2t\lambda_k^n)$$

as soon as $t \in \Delta_n = \{t \in \mathbb{R} / 2t\lambda_k^n < 1\}$.

Toeplitz and Cochran

Let $T_n(g)$ be the covariance matrix of $X^{(n)}$. By the Cochran theorem,

$$W_n = \frac{1}{n} \sum_{k=1}^n \lambda_k^n Z_k^n$$

- $\lambda_1^n, \dots, \lambda_n^n$ are the eigenvalues of $T_n(g)^{1/2} M_n T_n(g)^{1/2}$,
- Z_1^n, \dots, Z_n^n are iid with $\chi^2(1)$ distribution.

The normalized cumulant generating function of W_n is

$$L_n(t) = \frac{1}{n} \log \mathbb{E} \left[\exp(ntW_n) \right] = -\frac{1}{2n} \sum_{k=1}^n \log(1 - 2t\lambda_k^n)$$

as soon as $t \in \Delta_n = \{t \in \mathbb{R} / 2t\lambda_k^n < 1\}$.

LDP assumption. There exists $\varphi \in \mathbb{L}^\infty(\mathbb{T})$ not identically zero such that, if $m_\varphi = \text{essinf } \varphi$ and $M_\varphi = \text{esssup } \varphi$,

$$(H_1) \quad m_\varphi \leq \lambda_k^n \leq M_\varphi$$

and, for all $h \in \mathbb{C}([m_\varphi, M_\varphi])$,

$$(H_1) \quad \lim_{n \rightarrow \infty} \frac{1}{n} \sum_{k=1}^n h(\lambda_k^n) = \frac{1}{2\pi} \int_{\mathbb{T}} h(\varphi(x)) dx.$$

Under (H_1) , the asymptotic cumulant generating function is

$$L(t) = -\frac{1}{4\pi} \int_{\mathbb{T}} \log(1 - 2t\varphi(x)) dx$$

where $t \in \Delta = \{t \in \mathbb{R} / 2 \max(m_\varphi t, M_\varphi t) < 1\}$.

Large deviation principle

The Fenchel-Legendre dual of L is

$$I(c) = \sup_{t \in \mathbb{R}} \left\{ ct + \frac{1}{4\pi} \int_{\mathbb{T}} \log(1 - 2t\varphi(x)) dx \right\}.$$

Theorem (Bercu-Gamboa-Lavielle)

If (H_1) holds, the sequence (W_n) satisfies an **LDP** with rate function I . In particular, for all $c > \mu$

$$\lim_{n \rightarrow \infty} \frac{1}{n} \log \mathbb{P}(W_n \geq c) = -I(c).$$

$$\text{with } \mu = \frac{1}{2\pi} \int_{\mathbb{T}} \varphi(x) dx.$$

Sharp large deviation results

SLDP assumption. There exists H such that, for all $t \in \Delta$

$$(H_2) \quad L_n(t) = L(t) + \frac{1}{n}H(t) + o\left(\frac{1}{n}\right)$$

where the remainder is uniform in t .

Theorem (Bercu-Gamboa-Lavielle)

Assume that (H_1) and (H_2) hold. Then, for all $c > \mu$

$$\mathbb{P}(W_n \geq c) = \frac{\exp(-nl(c) + H(t_c))}{\sigma_c t_c \sqrt{2\pi n}} [1 + o(1)]$$

where t_c is given by $L'(t_c) = c$ and $\sigma_c^2 = L''(t_c)$.

Sharp large deviation results

SLDP assumption. For $p \geq 1$, there exists $H \in \mathcal{C}^{2p+3}(\mathbb{R})$ such that, for all $t \in \Delta$ and for any $0 \leq k \leq 2p + 3$

$$(H_2(p)) \quad L_n^{(k)}(t) = L^{(k)}(t) + \frac{1}{n} H^{(k)}(t) + \mathcal{O}\left(\frac{1}{n^{p+2}}\right)$$

where the remainder is uniform in t .

Remark. Assumption $(H_2(p))$ is not really restrictive. It is fulfilled in many statistical applications.

Theorem (Bercu-Gamboa-Lavielle)

For $p \geq 1$, assume that (H_1) and $(H_2(p))$ hold. Then, (W_n) satisfies an **SLDP** of order p associated with L and H . For all $c > \mu$, it exists $(d_{c,k})$ such that for n large enough

$$\mathbb{P}(W_n \geq c) = \frac{\exp(-nl(c) + H(t_c))}{\sigma_c t_c \sqrt{2\pi n}} \left[1 + \sum_{k=1}^p \frac{d_{c,k}}{n^k} + \mathcal{O}\left(\frac{1}{n^{p+1}}\right) \right].$$

Remark. The coefficients $(d_{c,k})$ may be given as functions of the derivatives $l_k = L^{(k)}(t_c)$ and $h_k = H^{(k)}(t_c)$. For example,

$$d_{c,1} = \frac{1}{\sigma_c^2} \left(-\frac{h_2}{2} - \frac{h_1^2}{2} + \frac{l_4}{8\sigma_c^2} + \frac{l_3 h_1}{2\sigma_c^2} - \frac{5l_3^2}{24\sigma_c^4} + \frac{h_1}{t_c} - \frac{l_3}{2t_c\sigma_c^2} - \frac{1}{t_c^2} \right).$$

 - Ornstein-Uhlenbeck process

Sum of squares

Our first statistical application is on the sum of squares

$$W_n = \frac{1}{n} \sum_{k=1}^n X_k^2.$$

We recall that $g \in \mathbb{L}^\infty(\mathbb{T})$ is the spectral density of the centered stationary real Gaussian process (X_n) .

Theorem (Bryc-Dembo)

The sequence (W_n) satisfies an **LDP** with rate function I which is the Fenchel-Legendre dual of

$$L(t) = -\frac{1}{4\pi} \int_{\mathbb{T}} \log(1 - 2tg(x)) dx.$$

Sum of squares

We shall often make use of the integral

$$\Delta(f) = \frac{1}{4\pi^2} \iint_{\mathbb{T}} \left(\frac{\log f(x) - \log f(y)}{\sin((x-y)/2)} \right)^2 dx dy.$$

Theorem (Bercu-Gamboa-Lavielle)

Assume that $g > 0$ on \mathbb{T} and g admits an analytic extension on the annulus $A_r = \{z \in \mathbb{C} / r < |z| < r^{-1}\}$ with $0 < r < 1$. Then, (W_n) satisfies an **SLDP** associated with L and H where

$$H(t) = \frac{1}{2} \Delta(1 - 2tg).$$

Neyman-Pearson

Let $g_0, g_1 \in \mathbb{L}^1(\mathbb{T})$ be two spectral densities. We wish to test

$$H_0 : \langle\langle g = g_0 \rangle\rangle \quad \text{against} \quad H_1 : \langle\langle g = g_1 \rangle\rangle.$$

For this simple hypothesis, the most powerful test is based on

$$W_n = \frac{1}{n} X^{(n)t} \left[T_n^{-1}(g_0) - T_n^{-1}(g_1) \right] X^{(n)}.$$

LRT assumption.

$$(H_3) \quad \log g_0 \in \mathbb{L}^1(\mathbb{T}) \quad \text{and} \quad \frac{g_0}{g_1} \in \mathbb{L}^\infty(\mathbb{T})$$

Theorem (Bercu-Gamboa-Lavielle)

- If (H_3) holds, then under H_0 , (W_n) satisfies an **LDP** with rate function I which is the Fenchel-Legendre dual of

$$L(t) = -\frac{1}{4\pi} \int_{\mathbb{T}} \log \left(\frac{(1-2t)g_1(x) + 2tg_0(x)}{g_1(x)} \right) dx.$$

- Assume that $g_0, g_1 > 0$ on \mathbb{T} and g_0, g_1 admit an analytic extensions on the annulus $A_r = \{z \in \mathbb{C} / r < |z| < r^{-1}\}$ with $0 < r < 1$. Then, under H_0 , (W_n) satisfies an **SLDP** associated with L and H where

$$H(t) = \frac{1}{2} \left(\Delta(g_1) - \Delta((1-2t)g_1 + 2tg_0) \right).$$

Theorem (Bercu-Gamboa-Lavielle)

- If (H_3) holds, then under H_0 , (W_n) satisfies an **LDP** with rate function I which is the Fenchel-Legendre dual of

$$L(t) = -\frac{1}{4\pi} \int_{\mathbb{T}} \log \left(\frac{(1-2t)g_1(x) + 2tg_0(x)}{g_1(x)} \right) dx.$$

- Assume that $g_0, g_1 > 0$ on \mathbb{T} and g_0, g_1 admit an analytic extensions on the annulus $A_r = \{z \in \mathbb{C} / r < |z| < r^{-1}\}$ with $0 < r < 1$. Then, under H_0 , (W_n) satisfies an **SLDP** associated with L and H where

$$H(t) = \frac{1}{2} \left(\Delta(g_1) - \Delta((1-2t)g_1 + 2tg_0) \right).$$

One can explicitly calculate L and H . For example, consider the autoregressive process of order p . For all $x \in \mathbb{T}$

$$g(x) = \frac{\sigma^2}{|A(e^{ix})|^2}$$

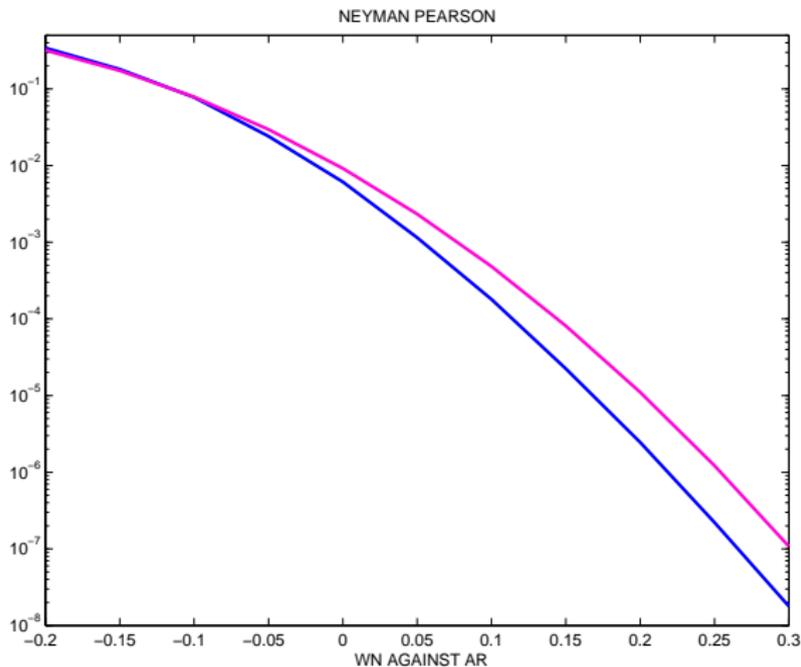

where A is a polynomial given by

$$A(e^{ix}) = \prod_{j=1}^p (1 - a_j e^{ix})$$

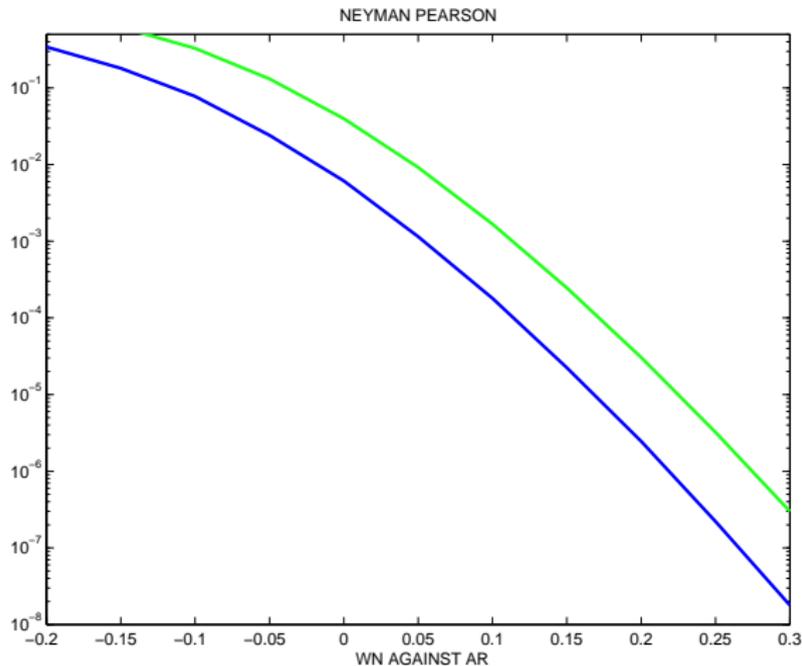

with $|a_j| < 1$. Then, we have $\frac{1}{2\pi} \int_{\mathbb{T}} \log g(x) dx = \log \sigma^2$ and

$$\Delta(g) = - \sum_{j=1}^p \sum_{k=1}^p \log(1 - a_j \bar{a}_k).$$

 - Ornstein-Uhlenbeck process

Stable autoregressive process

Consider the stable autoregressive process

$$X_{n+1} = \theta X_n + \varepsilon_{n+1}, \quad |\theta| < 1$$

where (ε_n) is iid $\mathcal{N}(0, \sigma^2)$, $\sigma^2 > 0$. If X_0 is independent of (ε_n) with $\mathcal{N}(0, \sigma^2/(1 - \theta^2))$ distribution, (X_n) is a centered stationary Gaussian process. For all $x \in \mathbb{T}$

$$g(x) = \frac{\sigma^2}{1 + \theta^2 - 2\theta \cos x}.$$

Let $\hat{\theta}_n$ be the **least squares** estimator of the parameter θ

$$\hat{\theta}_n = \frac{\sum_{k=1}^n X_k X_{k-1}}{\sum_{k=1}^n X_{k-1}^2}.$$

We have $\hat{\theta}_n \rightarrow \theta$ a.s. and $\sqrt{n}(\hat{\theta}_n - \theta) \xrightarrow{\mathcal{L}} \mathcal{N}(0, 1 - \theta^2)$. One can also estimate θ by the **Yule-Walker** estimator

$$\tilde{\theta}_n = \frac{\sum_{k=1}^n X_k X_{k-1}}{\sum_{k=0}^n X_k^2}.$$

$$a = \frac{\theta - \sqrt{\theta^2 + 8}}{4} \quad \text{and} \quad b = \frac{\theta + \sqrt{\theta^2 + 8}}{4}.$$

Theorem (Bercu-Gamboa-Rouault)

- $(\hat{\theta}_n)$ satisfies an **LDP** with rate function

$$J(x) = \begin{cases} \frac{1}{2} \log \left(\frac{1 + \theta^2 - 2\theta x}{1 - x^2} \right) & \text{if } x \in [a, b], \\ \log |\theta - 2x| & \text{otherwise.} \end{cases}$$

- $(\tilde{\theta}_n)$ satisfies an **LDP** with rate function

$$I(x) = \begin{cases} \frac{1}{2} \log \left(\frac{1 + \theta^2 - 2\theta x}{1 - x^2} \right) & \text{if } x \in]-1, 1[, \\ +\infty & \text{otherwise.} \end{cases}$$

$$a = \frac{\theta - \sqrt{\theta^2 + 8}}{4} \quad \text{and} \quad b = \frac{\theta + \sqrt{\theta^2 + 8}}{4}.$$

Theorem (Bercu-Gamboa-Rouault)

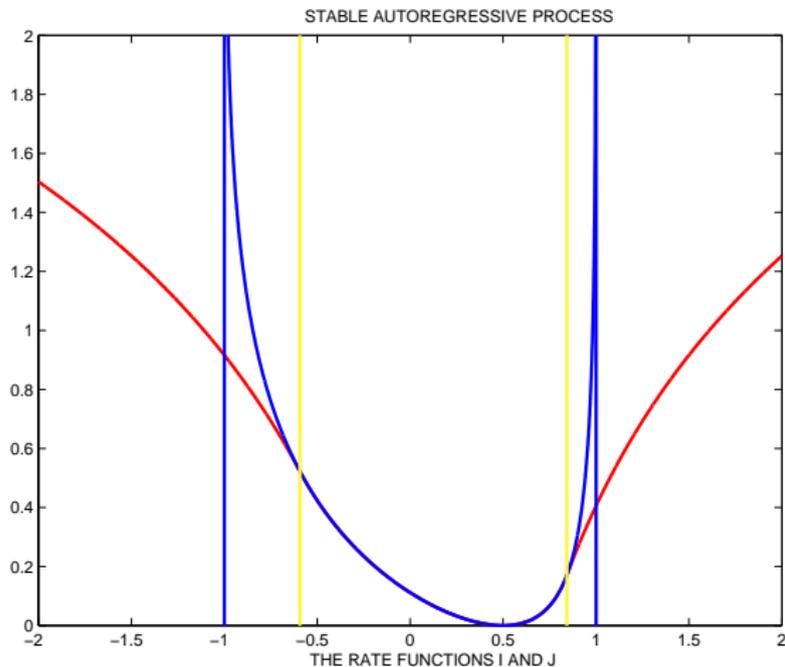

- $(\hat{\theta}_n)$ satisfies an **LDP** with rate function

$$J(x) = \begin{cases} \frac{1}{2} \log \left(\frac{1 + \theta^2 - 2\theta x}{1 - x^2} \right) & \text{if } x \in [a, b], \\ \log |\theta - 2x| & \text{otherwise.} \end{cases}$$

- $(\tilde{\theta}_n)$ satisfies an **LDP** with rate function

$$I(x) = \begin{cases} \frac{1}{2} \log \left(\frac{1 + \theta^2 - 2\theta x}{1 - x^2} \right) & \text{if } x \in]-1, 1[, \\ +\infty & \text{otherwise.} \end{cases}$$

Least squares and Yule-Walker

Yule-Walker

Theorem (Bercu-Gamboa-Lavielle)

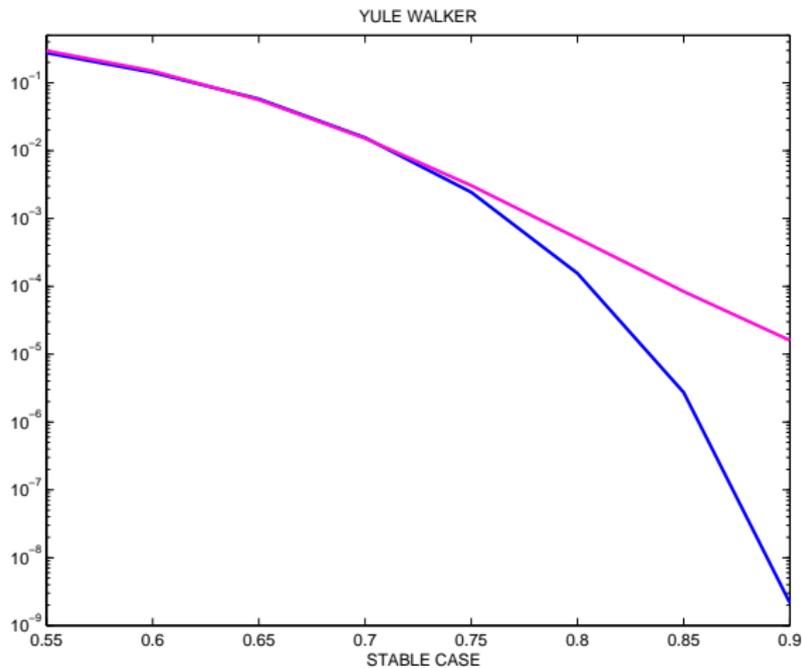

The sequence $(\tilde{\theta}_n)$ satisfies an **SLDP**. For all $c \in \mathbb{R}$ with $c > \theta$ and $|c| < 1$, it exists a sequence $(d_{c,k})$ such that for any $p \geq 1$ and n large enough

$$\mathbb{P}(\tilde{\theta}_n \geq c) = \frac{\exp(-nl(c) + H(c))}{\sigma_c t_c \sqrt{2\pi n}} \left[1 + \sum_{k=1}^p \frac{d_{c,k}}{n^k} + \mathcal{O}\left(\frac{1}{n^{p+1}}\right) \right]$$

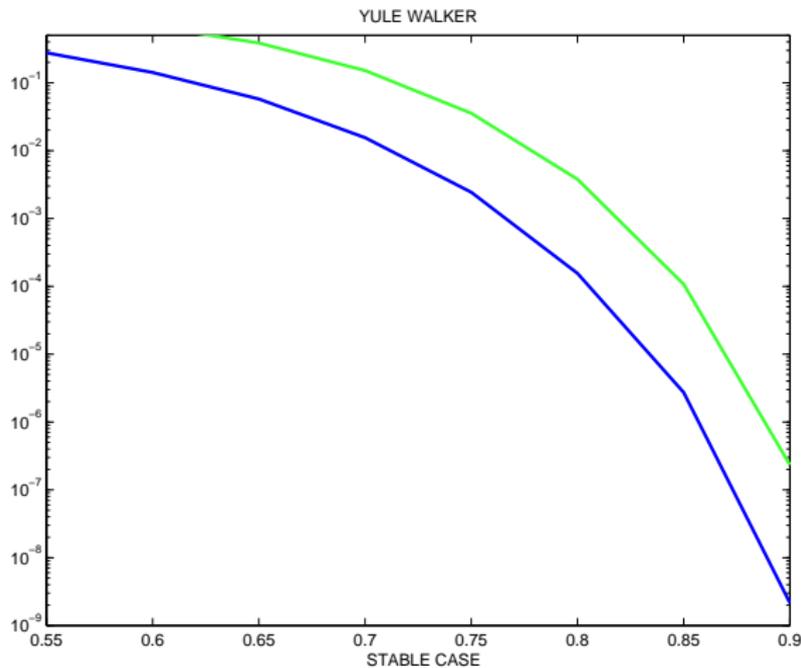

$$t_c = \frac{c(1 + \theta^2) - \theta(1 - c^2)}{1 - c^2}, \quad \sigma_c^2 = \frac{1 - c^2}{(1 + \theta^2 - 2\theta c)^2},$$

$$H(c) = -\frac{1}{2} \log \left(\frac{(1 - c\theta)^4}{(1 - \theta)^2 (1 + \theta^2 - 2\theta c)(1 - c^2)^2} \right).$$

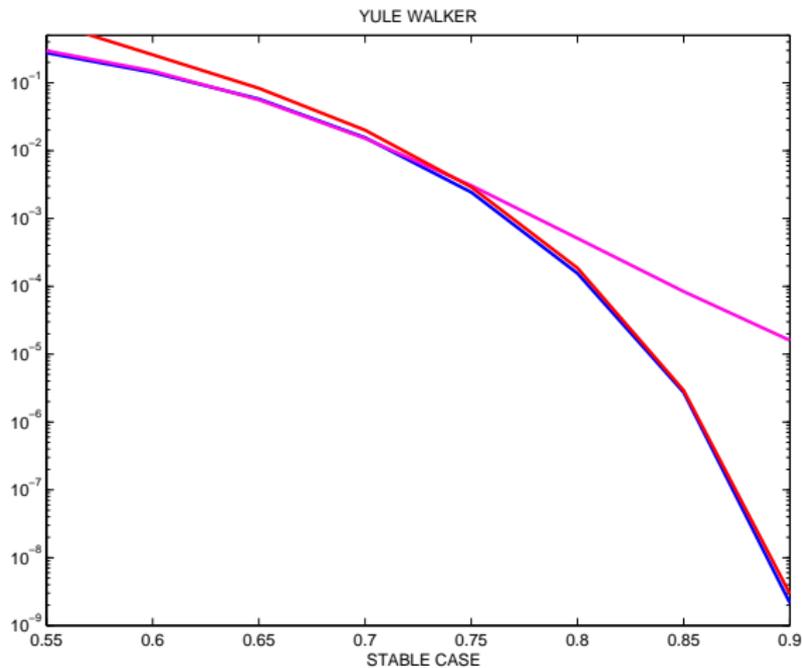

Yule-Walker

Yule-Walker

Yule-Walker

Explosive autoregressive process

Consider the explosive autoregressive process

$$X_{n+1} = \theta X_n + \varepsilon_{n+1}, \quad |\theta| > 1$$

where (ε_n) is iid $\mathcal{N}(0, \sigma^2)$, $\sigma^2 > 0$. The **Yule-Walker** estimator satisfies $\tilde{\theta}_n \rightarrow 1/\theta$ a.s. together with

$$|\theta|^n \left(\tilde{\theta}_n - \frac{1}{\theta} \right) \xrightarrow{\mathcal{L}} \frac{(\theta^2 - 1)}{\theta^2} \mathcal{C}$$

where \mathcal{C} stands for the Cauchy distribution.

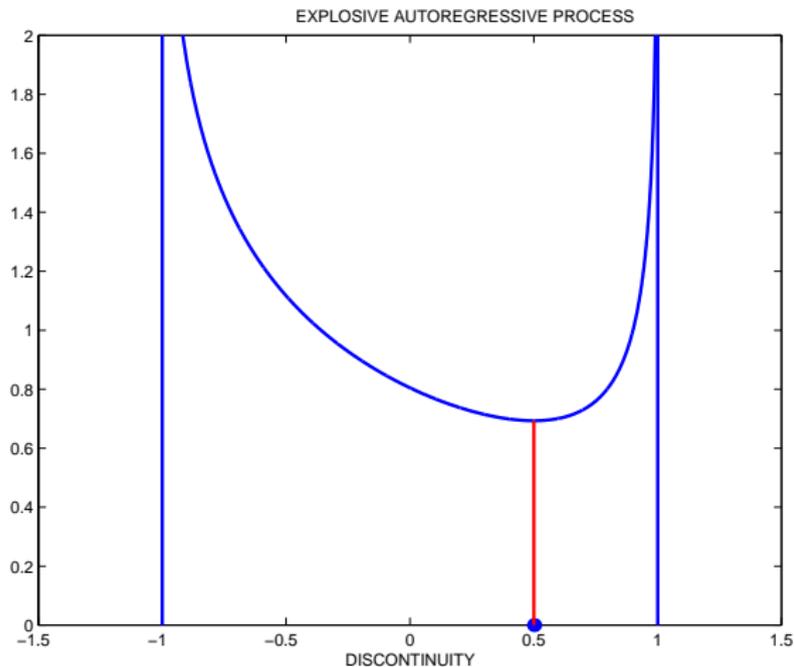

Explosive autoregressive process

Theorem (Bercu)

The sequence $(\tilde{\theta}_n)$ satisfies an **LDP** with rate function

$$I(x) = \begin{cases} \frac{1}{2} \log \left(\frac{1 + \theta^2 - 2\theta x}{1 - x^2} \right) & \text{if } x \in]-1, 1[, x \neq 1/\theta, \\ 0 & \text{if } x = 1/\theta, \\ +\infty & \text{otherwise.} \end{cases}$$

Discontinuity

Yule-Walker

Theorem (Bercu)

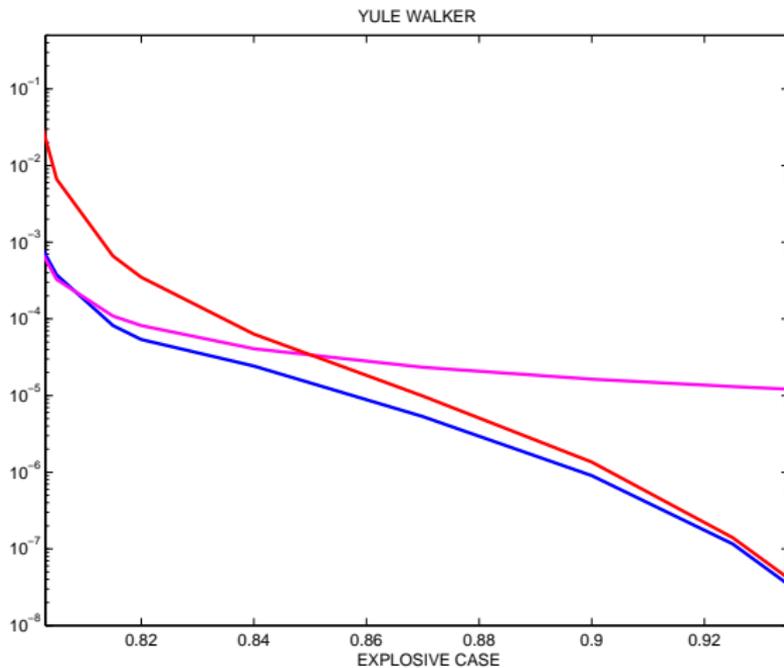

The sequence $(\tilde{\theta}_n)$ satisfies an **SLDP**. For all $c \in \mathbb{R}$ with $c > 1/\theta$ and $|c| < 1$, it exists a sequence $(d_{c,k})$ such that for any $p \geq 1$ and n large enough

$$\mathbb{P}(\tilde{\theta}_n \geq c) = \frac{\exp(-nl(c) + H(c))}{\sigma_c t_c \sqrt{2\pi n}} \left[1 + \sum_{k=1}^p \frac{d_{c,k}}{n^k} + \mathcal{O}\left(\frac{1}{n^{p+1}}\right) \right]$$

$$t_c = \frac{(\theta c - 1)(\theta - c)}{1 - c^2}, \quad \sigma_c^2 = \frac{1 - c^2}{(1 + \theta^2 - 2\theta c)^2},$$

$$H(c) = -\frac{1}{2} \log \left(\frac{(\theta c - 1)^2}{(1 + \theta^2 - 2\theta c)(1 - c^2)} \right).$$

Consider the stable Ornstein-Uhlenbeck process

$$dX_t = \theta X_t dt + dW_t, \quad \theta < 0$$

where (W_t) is a standard Brownian motion. We establish similar **SLDP** for **the energy**

$$S_T = \int_0^T X_t^2 dt,$$

the **maximum likelihood** estimator of θ

$$\hat{\theta}_T = \frac{\int_0^T X_t dX_t}{\int_0^T X_t^2 dt} = \frac{X_T^2 - T}{2 \int_0^T X_t^2 dt},$$

and the **log-likelihood ratio** given, for $\theta_0, \theta_1 < 0$, by

$$W_T = (\theta_0 - \theta_1) \int_0^T X_t dX_t - \frac{1}{2}(\theta_0^2 - \theta_1^2) \int_0^T X_t^2 dt.$$

Stable Ornstein-Uhlenbeck process

Theorem (Bryc-Dembo)

The sequence (S_T/T) satisfies an **LDP** with rate function

$$J(x) = \begin{cases} \frac{(2\theta c + 1)^2}{8c} & \text{if } c > 0, \\ +\infty & \text{otherwise.} \end{cases}$$

Theorem (Florens-Pham)

The sequence $(\hat{\theta}_T)$ satisfies an **LDP** with rate function

$$I(x) = \begin{cases} -\frac{(c - \theta)^2}{4c} & \text{if } c < \theta/3, \\ 2c - \theta & \text{otherwise.} \end{cases}$$

Stable Ornstein-Uhlenbeck process

Theorem (Bercu-Rouault)

The sequence $(\hat{\theta}_T)$ satisfies an **SLDP**. For all $\theta < c < \theta/3$, it exists a sequence $(d_{c,k})$ such that, for any $p \geq 1$ and T large enough

$$\mathbb{P}(\hat{\theta}_T \geq c) = \frac{\exp(-Tl(c) + H(c))}{\sigma_c t_c \sqrt{2\pi T}} \left[1 + \sum_{k=1}^p \frac{d_{c,k}}{T^k} + \mathcal{O}\left(\frac{1}{T^{p+1}}\right) \right]$$

$$t_c = \frac{c^2 - \theta^2}{2c}, \quad H(c) = -\frac{1}{2} \log \left(\frac{(c + \theta)(3c - \theta)}{4c^2} \right),$$

$\sigma_c^2 = -1/2c$. Similar expansion holds for $c > \theta/3$ with $c \neq 0$.

Stable Ornstein-Uhlenbeck process

Theorem (Bercu-Rouault)

- For $c = 0$, it exists a sequence (b_k) such that, for any $p \geq 1$ and T large enough

$$\mathbb{P}(\hat{\theta}_T \geq 0) = \frac{\exp(\theta T)}{\sqrt{\pi T} \sqrt{-\theta}} \left[1 + \sum_{k=1}^p \frac{b_k}{T^k} + \mathcal{O}\left(\frac{1}{T^{p+1}}\right) \right].$$

- For $c = \theta/3$, it exists a sequence (d_k) such that, for any $p \geq 1$ and T large enough

$$\mathbb{P}(\hat{\theta}_T \geq c) = \frac{\exp(-Tl(c))}{4\pi T^{1/4} \tau_\theta} \left[1 + \sum_{k=1}^{2p} \frac{d_k}{(\sqrt{T})^k} + \mathcal{O}\left(\frac{1}{T^p \sqrt{T}}\right) \right]$$

where $\tau_\theta = (-\theta/3)^{1/4} / \Gamma(1/4)$.
