Graphs versus trees

One result

Definition

(M,g) has bounded geometry if $\exists Q, \rho > 0$ such that $| \text{Sect}_g | \leq Q$ and $\text{inj}_g \geq \rho$.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

One result

Definition

(M,g) has bounded geometry if $\exists Q, \rho > 0$ such that $| \text{Sect}_g | \leq Q$ and $\text{inj}_g \geq \rho$.

Theorem (Bessières-B.-Maillot)

M has a complete metric of bounded geometry and $Scal \ge 1$ iff there is a finite collection \mathcal{F} of spherical manifolds such that *M* is a (maybe infinite) connected sum of copies of $S^2 \times S^1$ and members of \mathcal{F} .

 Compact case due to Perelman + Schoen-Yau or Gromov-Lawson.

Theorem

X is contractible and not homeomorphic to \mathbf{R}^3 .

- $W = \cap T_i$ is the Whitehead continuum.
- $X = S^3 \setminus W \subset S^3$ is a (the) whitehead manifold (genus one).

Theorem

X is contractible and not homeomorphic to \mathbf{R}^3 .

The idea is that the core of T_i and the meridian of T_{i-1} form the Whitehead link.

► The number of connected components of $\Sigma \cap N_1$ intersecting N_0 is infinite.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

- The number of connected components of $\Sigma \cap N_1$ intersecting N_0 is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.

- The number of connected components of Σ ∩ N₁ intersecting N₀ is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.
- An extrinsic version of Cohn-Vossen's inequality reads,

$$\int_{\Sigma}\kappa(x)dv(x)\leq 2\pi\,,$$

with $\kappa =$ ambient scalar curvature.

- The number of connected components of Σ ∩ N₁ intersecting N₀ is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.
- An extrinsic version of Cohn-Vossen's inequality reads,

$$\int_{\Sigma}\kappa(x)dv(x)\leq 2\pi\,,$$

with $\kappa =$ ambient scalar curvature.

• By compactness $\kappa(x) \ge C$ on N_1 ,

- The number of connected components of Σ ∩ N₁ intersecting N₀ is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.
- An extrinsic version of Cohn-Vossen's inequality reads,

$$\int_{\Sigma}\kappa(x)dv(x)\leq 2\pi\,,$$

with $\kappa =$ ambient scalar curvature.

▶ By compactness $\kappa(x) \ge C$ on N_1 , a contradiction !

- The number of connected components of Σ ∩ N₁ intersecting N₀ is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.
- An extrinsic version of Cohn-Vossen's inequality reads,

$$\int_{\Sigma}\kappa(x)dv(x)\leq 2\pi\,,$$

with $\kappa =$ ambient scalar curvature.

- ▶ By compactness $\kappa(x) \ge C$ on N_1 , a contradiction !
- Too naive,

- The number of connected components of Σ ∩ N₁ intersecting N₀ is infinite.
- ► Meeks-Yau ~>> each of these components contains a definite amount of area.
- An extrinsic version of Cohn-Vossen's inequality reads,

$$\int_{\Sigma}\kappa(x)dv(x)\leq 2\pi\,,$$

with $\kappa =$ ambient scalar curvature.

- By compactness $\kappa(x) \ge C$ on N_1 , a contradiction !
- Too naive, D_k converges towards a lamination with complete stable minimal leaves.
